InnoDisk FiD 2.5” SATA10000-RS

InnoDisk FiD 2.5” SATA10000-RS for SLC Solution

Datasheet

Ver1.7

Table of contents

REVISION HISTORY

Revision	Description	Date
Preliminary	First Released	06/10/2008
1.0	Update ATA Command for SMART and Security	09/01/2008
1.1	Update vibration specification	12/12/2008
1.2	Update unpainted housing appearance and dimension	05/27/2009
1.3	1. Update ATA Command Value 2. Update power requirement and power consumption value 3. Change housing appearance and product picture	06/05/2009
1.4	Modify ATA command value and description	06/11/2009
1.5	Modify ID table description	06/24/2009
1.6	1. Modify ATA command value and description 2. Modify content of bad block management 3. Add power consumption and device parameters	11/23/2009
1.7	1. Modify performance info.	1/12/2010

List of Figures

1. Product Overview

1.1 Introduction of InnoDisk FiD 2.5” SATA10000-RS

InnoDisk FiD 2.5” SATA10000-RS series supports SATA II standard (3.0Gb/s) interface with good performance and thus performs faster data transfer rate. Sustain read can reach up to 100MB per second (max), and sustain write reach up to 50MB per second (max). Moreover, InnoDisk FiD 2.5” SATA10000-RS is designed for industrial field with 2.5-inch form factor. The SSD have good performance, no latency time and small seek time. It effectively reduces the booting time of operation system and the power consumption is less than hard disk drive (HDD). InnoDisk FiD 2.5” SATA10000-RS can work in harsh environment. The SSD is vibration resistance, and can work in lower or higher temperature than HDD. InnoDisk FiD 2.5” SATA10000-RS complies with ATA protocol, no additional drives are required, and the SSD can be configured as a boot device or data storage device.

1.2 Product View

Figure 1: InnoDisk FiD 2.5” SATA 10000-RS

1.3 Product Models

InnoDisk FiD 2.5” SATA10000-RS is available in follow capacities.

FiD 2.5” SATA10000-RS 1GB (SLC)

FiD 2.5” SATA10000-RS 2GB (SLC)

FiD 2.5” SATA10000-RS 4GB (SLC)

FiD 2.5” SATA10000-RS 8GB (SLC)

FiD 2.5” SATA10000-RS 16GB (SLC)

FiD 2.5” SATA10000-RS 32GB (SLC)

1.4 SATA Interface

InnoDisk FiD 2.5” SATA10000-RS support SATA II interface, and compliant with SATA I. SATA II interface can work with Serial Attached SCSI (SAS) host system, which is used in server computer. InnoDisk FiD 2.5” SATA 10000-RS is compliant with Serial ATA Gen 1 and Gen 2 specifications (Gen2 supports 1.5Gbps /3.0Gbps data rate). SATA connector uses a 7-pin signal segment and a 15-pin power segment.

2. Theory of operation

2.1 Overview

Figure 2 shows the operation of InnoDisk FiD 2.5" SATA 10000-RS from the system level, including the major hardware blocks.

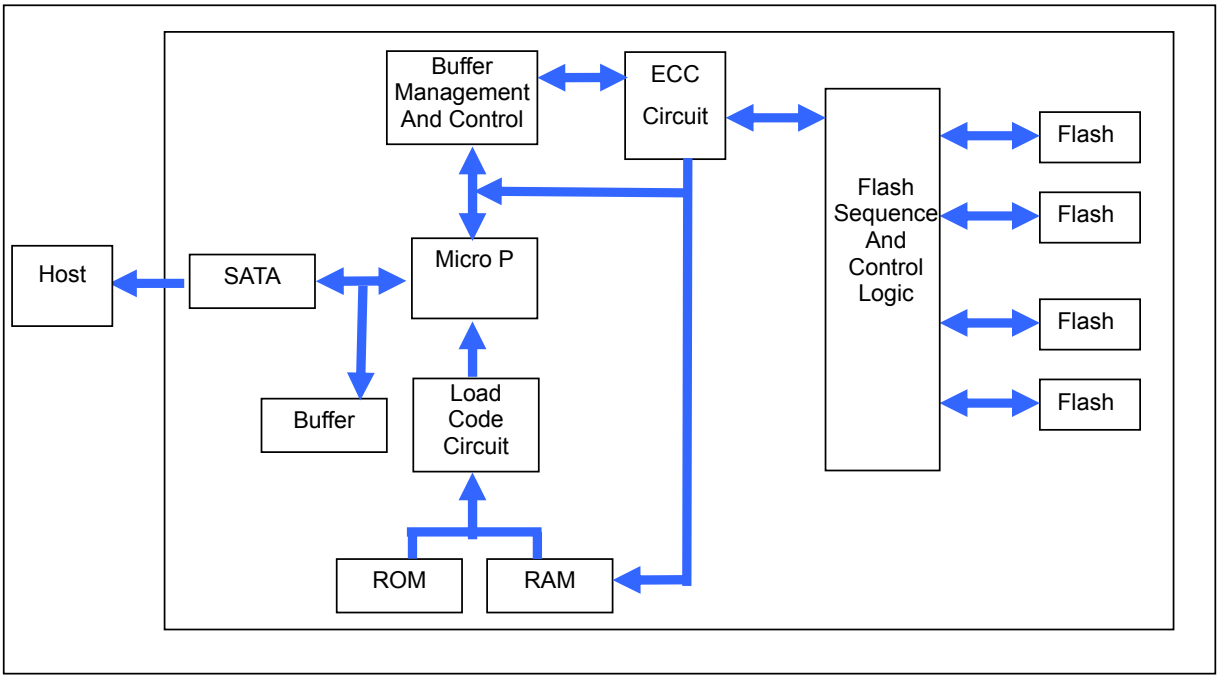

Figure 2: InnoDisk FiD 2.5" SATA 10000-RS Block Diagram

InnoDisk FiD 2.5" SATA 10000-RS integrates a SATA II controller and NAND flash memories. Communication with the host occurs through the host interface, using the standard ATA protocol. Communication with the flash device(s) occurs through the flash interface.

2.2 SATA II Controller

The SATA II controller is 3.0Gbps, and supports hot-plug. This SATA II controller support four flash IC and communicates with host interface, this SATA II controller can support the flash ICs both for 2kbyte and 4kbyte per page.

2.3 Error Detection and Correction

Highly sophisticated Error Correction Code algorithms are implemented. The ECC unit consists of the Parity Unit (parity-byte generation) and the Syndrome Unit (syndrome-byte computation). This unit implements an algorithm that can correct 8 bits per 512 bytes in an ECC block. Code-byte generation during write operations,

as well as error detection during read operation, is implemented on the fly without any speed penalties.

2.4 Wear-Leveling

Flash memory can be erased within a limited number of times. This number is called the ***erase cycle limit*** or ***write endurance limit*** and is defined by the flash array vendor. The erase cycle limit applies to each individual erase block in the flash device.

InnoDisk FiD 2.5” SATA 10000-RS uses a static wear-leveling algorithm to ensure that consecutive writes of a specific sector are not written physically to the same page and block in the flash. This spreads flash media usage evenly across all pages, thereby extending flash lifetime.

2.5 Bad Blocks Management

Bad Blocks are blocks that contain one or more invalid bits whose reliability are not guaranteed. The Bad Blocks may be presented while the SSD is shipped, or may develop during the life time of the SSD. The Bad Blocks will not exceed more than 6.25% of the total device volume. When the Bad Blocks is detected, it will be flagged, and not be used anymore. The SSD implement Bad Blocks management, Bad Block replacement, Error Correct Code to avoid data error occurred. The functions will be enabled automatically to transfer data from Bad Blocks to spare blocks, and correct error bit.

3. Installation Requirements

3.1 FiD 2.5 SATA 10000-RS Pin Directions

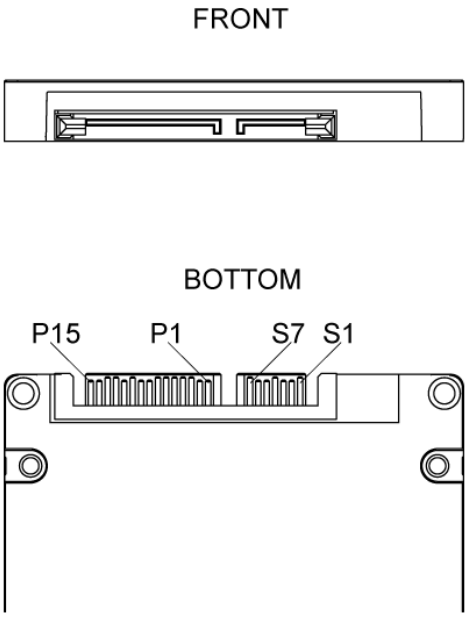

Figure 3: Signal Segment and Power Segment

3.2 Electrical Connections for FiD 2.5 SATA 10000-RS

A Serial ATA device may be either directly connected to a host or connected to a host through a cable. For connection via cable, the cable should be no longer than 1meter. The SATA interface has a separate connector for the power supply. Please refer to the pin description for further details.

3.3 Form Factor

Please prepare following things:

- Screw driver.
- Four M3 screws.
- SATA single cable (7-pin, Maximum length I meter).
- SATA power cable (15-pin).

Please turn off your computer, and open your computer’s case. Find one of available 2.5-inch slot, and plug the SSD in. To use the screws fix the SSD. Plug in the SATA single cable, and power cable.

Please boot the installation Operation System from CD-ROM, and install Operation System into SSD.

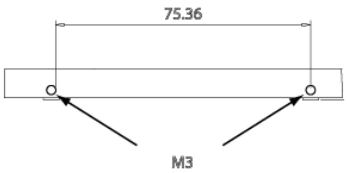

Figure 4: FiD 2.5” SATA 10000-RS Mechanical Screw Hole

3.4 Device drive

No additional device drives are required. The InnoDisk FiD 2.5” SATA 10000-RS can be configured as a boot device.

4. Specifications

4.1 CE and FCC Compatibility

InnoDisk FiD 2.5” SATA 10000-RS conforms to CE and FCC requirements.

4.2 RoHS Compliance

InnoDisk FiD 2.5” SATA 10000-RS is fully compliant with RoHS directive.

4.3 Environmental Specifications

4.3.1 Temperature Ranges

Operating Temperature Range:

- Standard Grade: 0°C to +70°C
- Industrial Grade: -40°C to +85°C

Storage Temperature Range:

- Standard Grade: -55°C to +95°C
- Industrial Grade: -55°C to +95°C

4.3.2 Humidity

Relative Humidity: 10-95%, non-condensing

4.3.3 Shock and Vibration

Table 1: Shock/Vibration Testing for InnoDisk FiD 2.5” SATA 10000-RS

Reliability	Test Conditions	Reference Standards
Vibration	7 Hz to 2K Hz, 20G, 3 axes	IEC 68-2-6
Mechanical Shock	Duration: 0.5ms, 1500 G, 3 axes	IEC 68-2-27

4.3.4 Mean Time between Failures (MTBF)

Table 2 summarizes the MTBF prediction results for various InnoDisk FiD 2.5” SATA 10000-RS configurations. The analysis was performed using a RAM Commander™ failure rate prediction.

- **Failure Rate**: The total number of failures within an item population, divided by the total number of life units expended by that population, during a particular measurement interval under stated condition.
- **Mean Time between Failures (MTBF)**: A basic measure of reliability for repairable items: The mean number of life units during which all parts of the item perform within their specified limits, during a particular

measurement interval under stated conditions.

Table 2: InnoDisk FiD 2.5” SATA 10000-RS MTBF

Product	Condition	MTBF (Hours)
InnoDisk FiD 2.5” SATA 10000-RS	Telcordia SR-332 GB, 25°C	TBD

4.4 Endurance

Read Cycles: Unlimited Read Cycles.

Data Retention: 10 years.

Wear-Leveling Algorithm: Support.

Bad Blocks Management: Support

Error Correct Code: Support

4.5 Transfer Mode

InnoDisk FiD 2.5” SATA 10000-RS support following transfer mode:

PIO Mode 0~4

Ultra DMA 0~6

Serial ATA I 1.5Gbps

Serial ATA II 3.0Gbps

4.6 Pin Assignment

InnoDisk FiD 2.5” SATA 10000-RS uses a standard SATA pin-out. See Table 3 for InnoDisk FiD 2.5” SATA 10000-RS pin assignments.

Table 3: InnoDisk FiD 2.5” SATA 10000-RS Pin Assignment

Name	Type	Description
S1	GND	NA
S2	A+	Differential Signal Pair A
S3	A-	
S4	GND	NA
S5	B-	Differential Signal Pair B
S6	B+	
S7	GND	NA
Key and Spacing separate signal and power segments		
P1	V33	3.3V Power
P2	V33	3.3V Power
P3	V33	3.3V Power, Pre-charge
P4	GND	NA
P5	GND	NA

P6	GND	NA
P7	V5	5V Power, Pre-Charge
P8	V5	5V Power
P9	V5	5V Power
P10	GND	NA
P11	DAS/DSS	Device Activity Signal / Disable Staggered Spinup
P12	GND	NA
P13	V12	12V Power, Pre-charge
P14	V12	12V Power
P15	V12	12V Power

4.7 Mechanical Dimensions

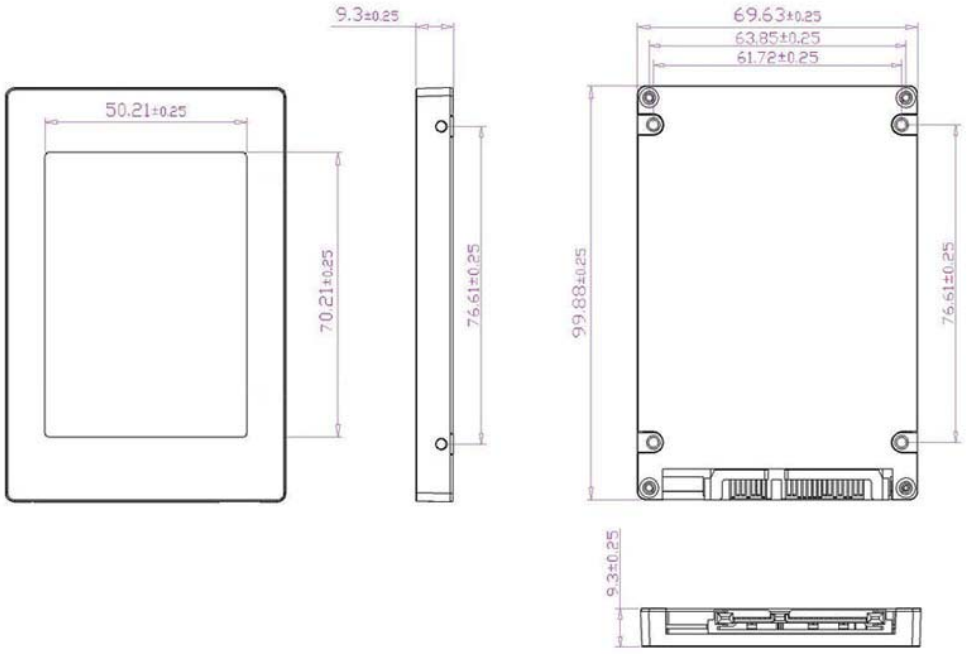

Figure 4: FiD 2.5 SATA 10000-RS mechanical dimensions

4.8 Assembly weight

An InnoDisk FiD 2.5” SATA 10000-RS within SLC flash ICs, 8GB’s weight is 90 grams approx. If the capacity is different, the flash chip’s weight needs to be added. However, the total weight of SSD will be less than 95 grams.

4.9 Performance

Burst Transfer Rate：3.0 Gbps

- 1GB、2GB：
  Sustained Read (Max.)：35MB/sec
  Sustained Write (Max.)：12MB/sec

- 4GB, 8GB, 16GB, and 32GB：
  Sustained Read (Max.)：100MB/sec
  Sustained Write (Max.)：50MB/sec

4.10 Seek Time

InnoDisk FiD 2.5” SATA 10000-RS is not a magnetic rotating design. There is no seek or rotational latency required.

4.11 Hot Plug

The SSD support hot plug function and can be removed or plugged-in during operation. User has to avoid hot plugging the SSD which is configured as boot device and installed operation system.

Surprise hot plug : The insertion of a SATA device into a backplane (combine signal and power) that has power present. The device powers up and initiates an OOB sequence.

Surprise hot removal: The removal of a SATA device from a powered backplane, without first being placed in a quiescent state.

4.12 NAND Flash Memory

InnoDisk FiD 2.5” SATA 10000-RS uses Single Level Cell (SLC) NAND flash memory, which is non-volatility, high reliability and high speed memory storage. There are only two statuses 0 or 1 of one cell. Read or Write data to flash memory for SSD is control by micro processor.

4.13 Electrical Specifications

4.13.1 Power Requirement

Table 4: InnoDisk FiD 2.5” SATA 10000-RS Power Requirement

Item	Symbol	Rating	Unit
Input voltage	V_{IN}	+5DC +- 5% 180mA (max.)	V

4.13.2 Power Consumption

Table 5: Power Consumption (mA)

Mode	Power Consumption
	SLC
Read	100
Write	150
Idle	55

4.14 Device Parameters

FiD 2.5 SATA 10000-RS device parameters are shown in Table 6.

Table 6: Device parameters

Capacity	LBA	Cylinders	Heads	Sectors	User Capacity
1GB	1965600	1950	16	63	959.77
2GB	3931200	3900	16	63	1919.53
4GB	7863408	7801	16	63	3839.55
8GB	15727824	15603	16	63	7679.6
16GB	31277056	16383	16	63	15272
32GB	62586880	16383	16	63	30560

5. Supported ATA Commands

5.1 Supported ATA Commands

InnoDisk FiD 2.5” SATA 10000-RS supports the commands listed in Table 7.

Table 7: ATA Commands

Class	Command	Code	FR	SC	SN	CY	DH	LBA
1	Check Power Mode	98H or E5H	-	-	-	-	D	-
1	Execute Device Diagnostic	90H	-	-	-	-	D	-
1	Erase Sector(s)	C0H	-	Y	Y	Y	Y	Y
2	Format Track	50H	-	Y	-	Y	Y	Y
1	Identify Device	ECH	-	-	-	-	D	-
1	NOP	00H	-	-	-	-	D	-
1	Read Buffer	E4H	-	-	-	-	D	-
1	Read Long Sector	22H or 23H	-	-	Y	Y	Y	Y
1	Read Verify Sector(s)	40H or 41H	-	Y	Y	Y	Y	Y
1	Recalibrate	1XH	-	-	-	-	D	-
1	Seek	7XH	-	-	Y	Y	Y	Y
1	Set Multiple Mode	C6H	-	Y	-	-	D	-
1	Set Sleep Mode	99H or E6H	-	-	-	-	D	-
1	Standby	96H or E2H	-	-	-	-	D	-
1	Standby Immediate	94H or E0H	-	-	-	-	D	-
2	Write Buffer	E8H	-	-	-	-	D	-

Defines:

FR: Feature Register

SC: Sector Count Register

SN: Sector Number Register

CY: Cylinder Registers

DH: Card/Device/Head Register

LBA: LBA Block Address Mode Supported

5.1.1 Check power mode – 98H or E5H

Table 8: Check power mode information

Register	7	6	5	4	3	2	1	0
Command(7)	98h or E5h							
C/D/H(6)	X			Drive	X			
Cylinder High(5)	X							
Cylinder Low(4)	X							
Sector Number(3)	X							
Sector Count(2)	X							
Feature(1)	X							

This command checks the power mode. If the CompactFlash Storage is in, going to, or recovering from the sleep mode, the SATADOM sets BSY, sets the Sector Count Register to 00h, clears BSY and generates an interrupt. If the SATADOM is in idle mode, the SATADOM sets BSY, sets the Sector Count Register to FFh, clears BSY and generates an interrupt.

5.1.2 Execute Device Diagnostic – 90H

Table 9: Execute device diagnostic information

Register	7	6	5	4	3	2	1	0
Command(7)	90h							
C/D/H(6)	X			Drive	X			
Cylinder High(5)	X							
Cylinder Low(4)	X							
Sector Number(3)	X							
Sector Count(2)	X							
Feature(1)	X							

This command performs the internal diagnostic tests implemented by the SATADOM. When the diagnostic command is issued in the True IDE Mode, the Drive bit is ignored and the diagnostic command is executed by both the Master and the Slave with the Master responding with status for both devices. The Diagnostic codes are shown in Table 34. Diagnostic Codes are returned in the Error Register at the end of the command.

Device register

DEV shall specify the selected device.

5.1.2.5 Outputs

5.1.2.5.1 Normal outputs

Table 10: Identify device command for normal outputs information

Register	7	6	5	4	3	2	1	0
Error	Na							
Sector Count	Na							
LBA Low	Na							
LBA Mid	Na							
LBA High	Na							
Device	obs	Na	obs	DEV	Na	Na	Na	Na
Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Device register

DEV shall indicate the selected device.

Status register

BSY shall be cleared to zero indicating command completion.

DRDY shall be set to one.

DF (Device Fault) shall be cleared to zero.

DRQ shall be cleared to zero.

ERR shall be cleared to zero.

5.1.2.6 Prerequisites

DRDY set to one.

5.1.2.7 Description

The IDENTIFY DEVICE command enables the host to receive parameter information from the device. When the command is issued, the device sets the BSY bit to one, prepares to transfer the 256 words of device identification data to the host, sets the DRQ bit to one, clears the BSY bit to zero, and asserts INTRQ if nIEN is cleared to zero. The host may then transfer the data by reading the Data register. Table 8 defines the arrangement and meaning of the parameter words in the buffer. All reserved bits or words shall be zero.

Some parameters are defined as a 16-bit value. A word that is defined as a 16-bit value places the most significant bit of the value on signal line DD15 and the least significant bit on signal line DD0. Some parameters are defined as 32-bit values (e.g. words (61:60)). Such fields are transfer using two successive word transfers. The device will first transfer the least significant bits, bits (15:0) of the value, on signal lines DD(15:0) respectively. After the least significant bits have been transferred, the most significant bits, bits(31:16) of the value, shall be transferred on DD(15:0) respectively.

Some parameters are defined as a string of ASCII characters.

Table 11: Identify device command parameters

Word	Description	Value
0	General configuration bit-significant information: 15 0 = ATA device 14-8 Retired 7 1 = removable media device 6 Obsolete 5-3 Retired 2 Response incomplete 1 Retired 0 Reserved	0040h

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ shall be cleared to zero.

ERR shall be cleared to zero.

5.1.5.1.6 Prerequisites

DRDY set to one. SMART enabled.

5.1.5.1.7 Description

This command returns the Device SMART data structure to the host.

Table 21: ID of SMART data structure

ID(Hex)	Description
E9	ECC Fail Record
EA	Average Erase Count, Max Erase Count
EB	Good Block Count, System Block Count

ID: E9h

Table 22: Smart command for ECC fail record information

Byte	Function	Description
0	ECC fail number	When failure bit is bigger than "ECC Fail number", this block will be marked as Bad Block.
1	Row address 3	Flash Block Address
2	Row address 2	Flash Block Address
3	Row address 1	Flash Block Address
4	Channel number of last ECC fail	NA
5	Bank number of last ECC fail	NA
6	Reserved	NA
7	Reserved	NA

ID: EAh

Table 23: Smart command for average/max erase count information

Byte	Function	Description
0	Average Erase Count (High Byte)	Average erase count of all blocks.
1	Average Erase Count	
2	Average Erase Count (Low Byte)	
3	Max Erase Count (High Byte)	Indicate a block which's erase count is the largest.
4	Max Erase Count	
5	Max Erase Count (Low Byte)	
6	Reserved	NA
7	Reserved	NA

- When the Maximum erase count is 255 bigger than average erase count, the wear-leveling will be executed.

ID: EBh

Table 24: Smart command for good/system block count information

Byte	Function	Description
0	Good Block Count (High Byte)	Total used blocks of SSD
1	Good Block Count	
2	Good Block Count (Low Byte)	
3	System(Free) Block Count (High Byte)	Free block of 8GB SSD. Free block has to be bigger than 20. When the free block count is less than 20, the SSD will be locked. For other capacities' free block have to be bigger than 40. When the free block count is less than 40, the SSD will be locked.
4	System(Free) Block Count (Low Byte)	
5	Reserved	NA
6	Reserved	NA
7	Reserved	NA

*For SATA10000-RS 16GB SSD, the below values are only for SATA10000-RS 16GB SLC

- Good block count= User/Data area + System area + Spare block

  Good block count=15272 + 16 + spare block

  Spare block depends on the invalid block number when first shipment from Samsung
- System(Free) block count：Spare block number

  Minimum system (free) block is 632

  The system block count of SSD shipped is higher than 632.
- Available SMART information

  Min good block count = 15272 + 16 + 632 = 15920

  Min system (free) block count = 632

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.7.6 Prerequisites

DRDY set to one.

5.1.7.7 Description

This command reads from 1 to 256 sectors as specified in the Sector Count register. A sector count of 0 requests 256 sectors. This transfer shall begin at the sector specified in the LBA Low, LBA Mid, LBA High, and Device registers. The DRQ bit is always set to one prior to data transfer regardless of the presence or absence of an error condition. The device shall interrupt for each DRQ block transferred.

5.1.9.4 Normal Output

Table 39: Read DMA command for normal output information

Register	7	6	5	4	3	2	1	0
Error	Na							
Sector Count	Na							
LBA Low	Na							
LBA Mid	Na							
LBA High	Na							
Device	obs	Na	obs	DEV	Na	Na	Na	Na
Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Device register-

DEV shall specify the selected device.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be cleared to zero.

5.1.9.5 Error Outputs

An unrecoverable error encountered during the execution of this command results in the termination of the command. The Command Block registers contain the address of the sector where the first

unrecoverable error occurred. The amount of data transferred us indeterminate.

Table 40: Read DMA command for error output information

Register	7	6	5	4	3	2	1	0
Error	ICRC	UNC	MC	IDNF	MCR	ABRT	NM	Obs
Sector Count	Na							
LBA Low	LBA(7:0)							
LBA Mid	LBA(15:8)							
LBA High	LBA(23:16)							
Device	Obs	Na	obs	DEV	LBA(27:24)			
Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Error register-

ICRC shall be set to one if an interface CRC error has occurred during an Ultra DMA data transfer. The content of this bit is not applicable for Multiword DMA transfers.

UNC shall be set to one if data is uncorrectable.

IDNF shall be set to one if a user-accessible address could not be found.

LBA Low, LBA Mid, and LBA High, Device

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.9.6 Prerequisites

DRDY set to one. The host shall initialize the DMA channel.

5.1.9.7 Description

The READ DMA command allows the host to read data using the DMA data transfer protocol.

5.1.10 Set Feature

TBD

5.1.11 Set Multiple Mode

5.1.11.1 Command Code

C6h

5.1.11.2 Protocol

Non-data

5.1.11.3 Inputs

If the content of the Sector Count Register is not zero, then the Sector Count register contains the number of sectors per block for the device to be used on all following READ/WRITE MULTIPLE commands. The content of the Sector Count register shall be less than or equal to the value in bits

(7:0) in word 47 in the IDENTIFY DEVICE information. The host should set the content of the Sector Count register to 1.

Table 41: Set multiple mode command for inputs information

Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Error register-

ABRT may be set to one if the device is not able to complete the action requested by the command.

LBA Low, LBA Mid, and LBA High, Device

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.13.6 Prerequisites

DRDY set to one.

5.1.13.7 Description

This command is used by the host to request the device to flush the write cache. If there is data in write cache, that data shall be written to the SSD. The BSY bit shall remain set to one until all data has been successfully written or an error occurs.

5.1.14 Standby

5.1.14.1 Command Code

E2h

5.1.14.2 Protocol

Non-data

5.1.14.3 Inputs

The value in the Sector Count register when the STANDBY command is issued shall determine the time period programmed into the Standby timer.

Device	Obs	Na	obs	DEV	LBA(27:24)			
Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Error register-

IDNF shall be set to one if a user-accessible address could not be found. IDNF shall be set to one if an address outside of the range user-accessible address is requested if command aborted is not returned.

ABRT shall be set to one if an error, include an ICRC error, has occurred during an Ultra DMA data transfer. ABRT shall be set to one if an address outside of the range of user-accessible address is requested if IDNF is not set to one.

LBA Low, LBA Mid, and LBA High, Device -

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be set to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.16.6 Prerequisites

DRDY set to one. If bit 8 of IDENTIFY DEVICE word 59 is cleared to zero, a successful SET MULTIPLE MODE command shall proceed a WRITE MULTIPLE command.

5.1.16.7 Description

This command writes the number of sectors specified in the Sector Count register.

The number of sectors per block is defined by the content of word 59 of the IDENTIFY DEVICE response.

When the WRITE MULTIPLE command is issued, the SECTOR Count register contains the number of sectors (not the number of blocks) requested. The device shall interrupt for each DRQ block transferred.

IF the number of requested sectors is not evenly divisible by the block count, as many full blocks as possible are transferred, followed by a final, partial block transfer. The partial block transfer is for n sectors, where:
N = Remainder (sector count / block count).

If the WRITE MULTIPLE command is received when WRITE MULTIPLE commands are disabled, the Write Multiple operation shall be rejected with command aborted.

Device errors encountered during WRITE MULTIPLE commands are posted after the attempted device write of the block or partial block transferred. The command ends with the sector in error, even if the error was in the middle of a block. Subsequent blocks are not transferred in the event of an error.

The contents of the Command Block Registers following the transfer of a data block that had a sector in error are undefined. The host should retry the transfer as individual requests to obtain valid error information. Interrupt pending is set when the DRQ bit is set to one at the beginning of each block or partial block.

5.1.17 Write Sector

5.1.17.1 Command Code

30h

5.1.17.2 Protocol

PIO data-out

5.1.17.3 Inputs

The LBA mid, LBA High, Device, and LBA Low specify the starting sector address to be written. The Sector Count register specifies the number of sectors to be transferred.

Table 59: Write sector command for inputs information

5.1.20.6 Prerequisites

DRDY set to one.

5.1.20.7 Description

This command transfer 512 byte of data from the host. Table 10 defines the content of this information. The data transferred controls the function of this command. Table 11 defines the interaction of the identifier and security level bits.

The revision code field shall be returned in the IDENTIFY DEVICE word 92. The valid revision codes are 0001h through FFFEh. A value of 0000h or FFFFh indicates that the Master Password Revision Code is not supported.

Table 71: Security set password command's data content

Word	Content
0	Control Word Bit 0 Identifier 0=set User password 1=set Master password Bits (7:1) Reserved Bit(8) Security level 0=High 1=Maximum Bits(15:9) Reserved
1-16	Password(32 bytes)
17	Master Password Revision Code()
18-255	Reserved

Table 72: Security Set password command's identifier and security level bit interaction

Identifier	Level	Command result
User	High	The password supplied with the command shall be saved as the new User password. The Lock mode shall be enabled from the next power-on or hardware reset. The device shall than be unlocked by

		either the User password it the previously set Master password.
User	Maximum	The password supplied with the command shall be saved as the new User password. The lock mode shall be enabled from the next power-on or hardware reset. The device shall then be unlocked by only the User password. The Master password previously set is still stored in the device but shall not be unlock
Master	High or Maximum	This combination shall set a Master password but shall not enable or disable the Lock mode. The security level is not changed. Master password revision code set to the value in Master Password Revision Code field.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.21.6 Prerequisites

DRDY set to one.

5.1.21.7 Description

This command transfers 512 bytes of data from the host. Table13 defines the content of this

information. If the Identifier bit is set to Master and the device is in high security level, then the password supplied shall be compared with the stored Master password. If the device is in maximum security level then the unlock shall be rejected.

If the Identifier bit is set to user then the device shall compare the supplied password with the stored User password. If the password compare fails then the device shall return command aborted to the host and decrements the unlock counter. This counter shall be initially set to five and shall decremented for each password mismatch when SECURITY UNLOCK and SECURITY ERASE UNIT commands shall be command aborted until a power-on reset or a hardware reset. SECURITY UNLOCK commands issued when the device is unlocked have no effect on the unlock counter.

DRDY will be set to one.

DF (Device Fault) should be set to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.23.6 Prerequisites

DRDY set to one. This command shall be immediately preceded by a SECURITY ERASE PREPARE command.

5.1.23.7 Description

This command transfer 512 bytes of data from the host. Table12 defines the content of this information. If the password does not match the password previously saved by the device, the device shall reject the command with command aborted.

The SECURITY ERASE PREPARE command shall be completed immediately prior to the SECURITY ERASE UNIT command. If the device receives a SECURITY ERASE UNIT command without an immediately prior SECURITY ERASE PREPARE command, the device

shall command abort the SECURITY ERASE UNIT command.

When Normal Erase mode is specified, the SECURITY ERASE UNIT command shall write binary zeroes to all user data areas. The Enhanced Erase mode is optional. When Enhanced Erase Mode is specified, the device shall write predetermined data patterns to all user areas. In Enhanced Erase mode, all previously written user data shall be overwritten, including sectors that are no longer in use due to reallocation.

This command shall disable the device Lock mode, however, the Master password shall still be stored internally within the device and may be reactivated later a new User password is set.
